## License

recipeShelf is based on proprietary code (source-available) and bundled with jQuery (MIT license). Copying -except for own use-, modifying or redistributing any of the recipeShelf code is not permitted.

**Copyright 2011 Oliver Seidel, Nicole Stich**

### Icons

Some (4) of the icons based on Joseph Wain's 'glyphish' set [glyphish.com].

### Backgrounds

Some backgrounds are based on the works of Harvey Rayner / patterncooler.com.

## Supported Languages Disclaimer

recipeShelf per se is only shipped in English as a main application language. Despite other language packs included (and supported by the application), such as German, Spanish, Hungarian etc., they're all authored by other users.

**NOTE: There is no guarantee that a language will always be available or continued going forward, it is entirely up to the individual contributors to further support their outstanding work so far.**

## Roadmap

Disclaimer: All roadmap items are subject to change.

### Wordpress Support

Future versions of recipeShelf are planned to support Wordpress users in providing a means to include recipe data (ingredients, method etc.) in a formatted way into Wordpress posts and pages.

### Twitter, Facebook / Social Media Support

While recipeShelf was always meant to be a personal tool, the option to share your recipes, in which ever form, sounds intriguing. Again, no promises IF and WHEN this feature will make it.

# Installation

## Installation requirements

recipeShelf merely requires the following:

- A few MB of web space
- **PHP** version 4.3x or greater (basic)
- **GD** Library (only for auto image resizing)
- **MySQL** version 4.1.2 or greater (basic)

recipeShelf runs best on these browsers:

- Firefox 2+
- IE 7+,
- Safari
- Opera and your iPhone

make sure to have an up-to-date version.

## Things to know

- **Access** to your web server (via shell or FTP)
- A **text editor**
- An **FTP client**

## New Installation

Begin your installation by

- **Downloading** the latest release of recipeShelf
- **Unzip** the downloaded file to a folder on your hard drive
- **Create a database** for recipeShelf on your web server, as well as a **MySQL user** who has all privileges for accessing and modifying it
  - *If the above step is too cryptic, please get in touch with your web developer or system administrator, or web hosting company*
- Open **recipeShelf/db-config-sample.php** in your favorite text editor and fill in your **database details**, then save as **db-config.php**
- **Place all** the recipeShelf files in the desired location on your web server
- Run the recipeShelf installation script:  
 [ <http://mysite.com/myfolder/recipesshelf> ]/index.php  
**Note:** The above part in brackets [...] is dependent on your domain and installation path setup!

recipeShelf will now verify your DB connection (per your configuration above) and will guide you through the one-click installation.

### A couple of hints:

- Make your **/recipesshelf/photos** folder **writable** all other folders are happy with permissions set to 550 and files to 440.
- If you want to use **recipeShelfs Backup/Restore feature**, make sure to **disable PHP safe mode**, your hosting provider know what to do 😊
- If you'd like to make your installation even more secure, make use of the **.htaccess** possibilities to e.g. setup additional password protection, IP deny/access rules etc.

## Upgrading from v.92 to v1.0

**Note:** Before doing anything, we recommend your make a **backup/copy of your complete recipeShelf directory** (on the web server), including your uploaded photos. Optionally you could even make a **database backup** through your web server's control panel. Just to be safe.

The actual upgrading process should be piece of cake. Simply upload / copy the new recipeShelf files to your server and access your recipeShelf site.

This will do three things:

1. recipeShelf requires you to **login as the main user**
2. recipeShelf will **force a complete database backup** and offers it for download to your local computer
3. recipeShelf will **update your database tables** and will report back

That's it.

In the unlikely event that the upgrade fails, you can always go back and reinstall the v.92 and use your web server's control panel to restore the recipeShelf database tables using the SQL backup files produced in step 2.

## Upgrading to v1.3

PLEASE READ THE ABOVE UPGRADE NOTE FIRST :-)

In addition, the upgrade to v1.3 requires you to revisit your **db-config.php** file to adjust and add new settings, please consult the sample **db-config-sample.php** file that ships with v1.3 for reference.

### Security Note

With **version 1.3** I've made every attempt to enhance security across the board, primarily addressing XSS hack/spam attempts as well as SQL injection.

If you do see odd, unexpected behaviour please let us know.

# Usage

## How to use recipeShelf

Find below a quick reference cheat sheets (screenshots) as a starting point to discover recipeShelf's features and functionality.

## Keyboard Shortcuts

See below a summary of all supported keyboard shortcuts and their functions.

Shortcut	Function
CTRL + S	Save / update recipe
CTRL + N	New recipe
CTRL + F	Open "Search" sidebar module
CTRL + ↵	Add a row (depending on context)
CTRL + T	Toggle editor / Recipe Layout
CTRL + I	Open "Ideas" sidebar module
CTRL + P	Print recipe
CTRL + M	Email recipe
CTRL + U	User settings
CTRL + A	Admin screen
CTRL + L	Switch language
CTRL + B	Message board
CTRL + H	This help page

**Tip:** The not so intuitive shortcut **CTRL + ↵** allows you to quickly add more input lines depending on the area you are working on, e.g. when your cursor rests in the *ingredients* section, an additional ingredients line would occur.

**Please Note:** Not all browsers support all shortcuts that recipeShelf uses. Chrome for instance refuses to play nice and reserves certain keys for itself.

## Image upload and auto resize

### What if: Can't upload images error

If you encounter errors during your photo upload, make sure to double- and tripple-check the **access permissions** on your server's **/photo** folder (inside your recipeShelf directory). Perhaps even remove it and recreate it with permissions set to 755.

### What if: Images aren't automatically resized

This feature requires PHP to support **GD library** functions for advanced image processing. You may want to check with your web hosting company on this.

**Ingredients are being recorded and are offered as drop downs for quick entry**

Level: [dropdown]

Add all ingredients

Amount	Unit	Ingredient	Info
250	g	ricotta	
1		egg yolk	
1/4-1/2	tbsp	fine sea salt	
30	g	Parmesan (or Pecorino)	freshly grated
50-75	g	all-purpose flour	extra for dusting the dough/board

Add AN INGREDIENT Add SPACE

**Recipe Steps**

1. Discard any excess liquid that the Ricotta's packaging may contain, then add Ricotta cheese, egg yolk, salt and freshly grated Parmigiano into a large bowl. Mix well with a wooden or regular spoon. Now add the flour and stir in briefly, just until combined - the dough will still be quite sticky. (Of course you can add more flour at this point, but keep in mind, that the more flour you use, the denser the gnocchi become in the end. And you want them to be as light & fluffy as possible, with a velvet-like texture.)
2. Forming these gnocchi is the slightly tricky step, this is the technique that works best for me: Generously flour a board, take a big tablespoon of the dough and scoop it onto the board. It gets dusted with flour (dust your hands generously, too!), before rolling it into a finger-thick roll. Cut it into little pillows (stick the

## Database administration

recipeShelf version 1.0 and beyond comes with a admin features that help keep your recipeShelf database tables and data stored therein in good shape.

### Ingredients data and email addresses

Data pertaining to *Units*, *Ingredients*, *Additional Info* and *Email Addresses* that you have entered in recipeShelf is being recorded for future popup suggestions. Here you can clean up all recorded elements:

The screenshot shows the 'ADMINISTRATION' window with the 'Ingredients' tab selected. At the top, there are navigation tabs: Units, Ingredients, Additional Info, Email Addresses, Additional Users, Backup & Restore, and Import & Export. Below the tabs is a search bar with a magnifying glass icon, a 'Search' button, and a 'Delete All' button. The main area displays a list of ingredients as blue buttons with a close 'x' icon. The ingredients listed include: 'Blender', abgekühlter Espresso, Ahornsirup, altbackene Semmeln, altbackenes Schwarzwälder Brot, alte Rosinenbrötchen, alter Balsamico, Anchovies, Aperol, Apfel, Austernsauce, Sesamöl, Avocado, Backpulver, Baiser, Balsamico-Essig, Banane, Basilikum oder Petersilie, Bio-Zitrone, Birne, Birnen, Blaubeeren, Blutorangen, brauner Zucker, Brot und Schmand dazu, Butter, Butter, kalt, Butternut-Kürbis, Butterschmalz, Cayennepfeffer, Chilischote, Chilischoten, Chorizo, Creme fraiche, Datteln, Demi Glacé, Ei, Ei (M-L), Eidotter, Eier, Eier (M), Eigelb, Eigelb (L), Emmenthaler, entfettete Rinderbrühe, Erdnussöl, Essiggurke, and evtl. Shrimp. A 'RETURN' button is located at the bottom center.

### Additional Read-Only users

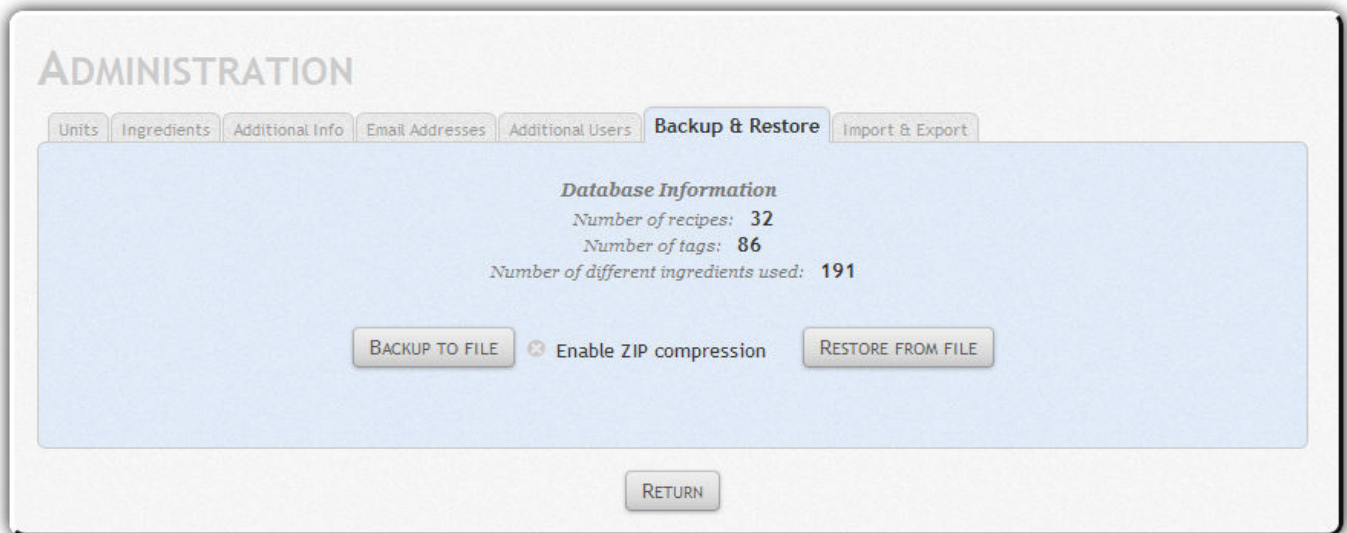

recipeShelf supports only one main user/admin account, however, you can create as many read-only accounts as you wish. These accounts will be able to use recipeShelf (browser & iPhone) like you do, but without being able to change any recipe data. The *Favorites* and *Ideas* modules of course work fine.

The screenshot shows the 'ADMINISTRATION' window with the 'Additional Users' tab selected. The navigation tabs are the same as in the previous screenshot. Below the tabs is a search bar with a magnifying glass icon, a 'Search' button, and a 'Delete All' button. The main area displays a list of read-only users as blue buttons with a close 'x' icon. One user is listed: 'ReadOnlyUser'. Below this list is a section titled 'NEW READ-ONLY USER' with two input fields: 'Username' and 'Email Address', followed by an 'Add User' button. A 'RETURN' button is located at the bottom center.

## Backing up and restoring your recipeShelf database

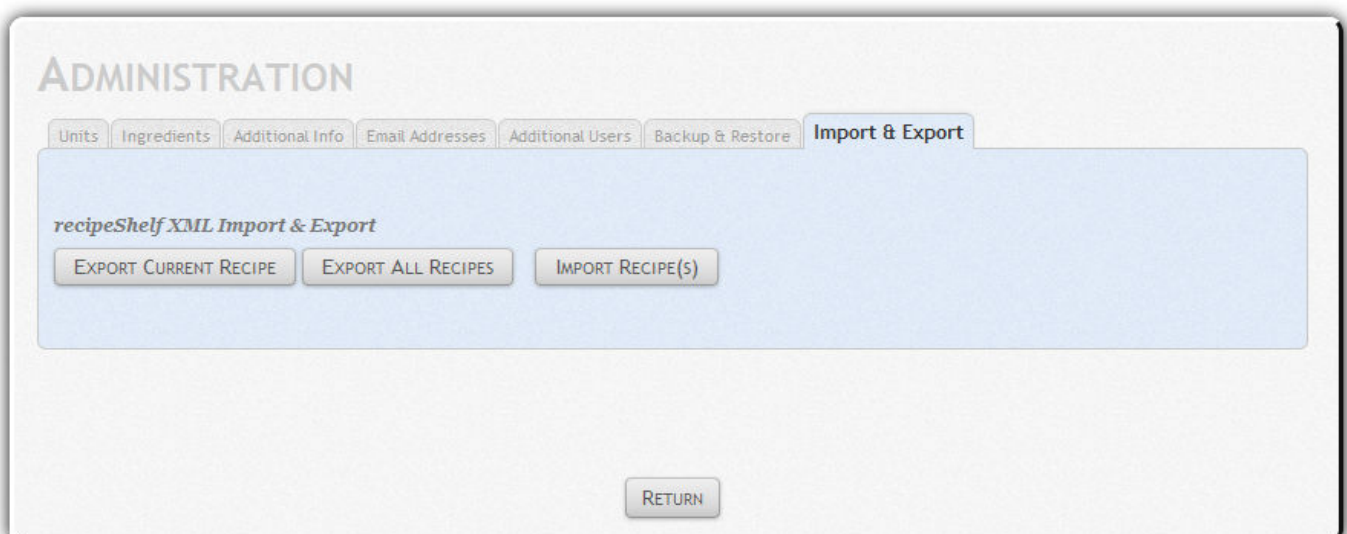

Please note that this feature only backs up your data entered, **not photos uploaded to the server**. If you don't keep your photos locally on your PC or laptop anyway, you may want to manually trigger directory backups for your /photo/ folder.

**ZIP compression** allows you to decrease the size of the download file and can directly be restored. No unzipping required.

## Exporting and importing recipes

To export a specific recipe to perhaps share with other recipeShelf users, you need to first select it and then come back here:

# iPad

## How to use recipeShelf on the iPad

Using the iPad you have two options:

1. access the regular recipeShelf user interface and URL via  
[ <http://mysite.com/myfolder/recipeShelf /index.php>
2. or, as explained below (see iPhone section), using the limited, iPhone specific interface:  
[ <http://mysite.com/myfolder/recipeShelf /iphone/index.php>

With version 1.2, recipeShelf introduced much better iPad support for the regular user interface (see bullet point #1 above). While recipeShelf is not a native app - it can't be bought in the app store- , it supports iPad (and iPhone) specific concepts such as:

- **portrait** versus **landscape** viewing mode
- **pich** and **spread** hand gestures to grow & shrink the editor window
- **double tap** for the popup menu

## iPad specific limitations

Unfortunately the iPad doesn't support all features and functions a normal browser does, hence there are a few limitations, including:

- recipe images/photos can't be uploaded
- There is **no HTML WYSIWYG** editor for the iPad, but you can insert HTML tags yourself, if you want to
- **ingredients** and **sidebar** modules can't be sorted/rearranged

# iPhone

## How to setup/use recipeShelf on the iPhone

The iPhone optimized application can be accessed via (see sample screenshots at the end of this document):

[ <http://mysite.com/myfolder/recipeShelf> ]/**iphone**/index.php

For best iPhone experience, follow these steps after browsing to the above (your) application URL:

3. With the recipeShelf login page displayed, add it as a **BOOKMARK**

4. Pick **ADD TO HOMESCREEN** and add

5. Exit Safari which takes you back to the iPhone home screen, and click on the newly created **RECIPESHELF** icon

This will allow recipeShelf to make better use of the screen and other user interface features.

## Experimental recipeShelf offline use

Since recipeShelf isn't a native iPhone app with its own local database supporting an offline mode (when in **Airport Mode** or with no reception) bears its challenges.

The currently implemented experimental feature works is intended to work the following way:

1. **Start** by clicking on your iPhone homepage recipeShelf icon (not by using Safari!)
2. You should be seeing a **'Caching...'** popup in the upper left corner, which you'll always see when you add new images to recipes

**Note:** If you don't see the "Caching..." popup, your iPhone may already be in sync

3. Now go to your main options menu (top right corner) and select **Sync for offline use**

4. Now you should be able to **exit recipeShelf**, go into **Airport Mode**, return to recipeShelf and use it as if you were online (limited features now)

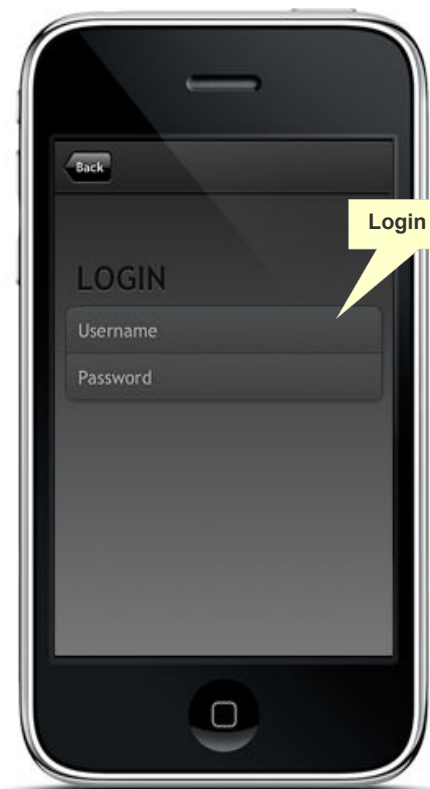

## iPhone not in sync

If recipeShelf on your iPhone is not reflecting e.g. the new background you picked on the full browser version of recipeShelf, or is not picking up the new language selection, try to **erase the iPhone Safari cache under your iPhone Settings**.

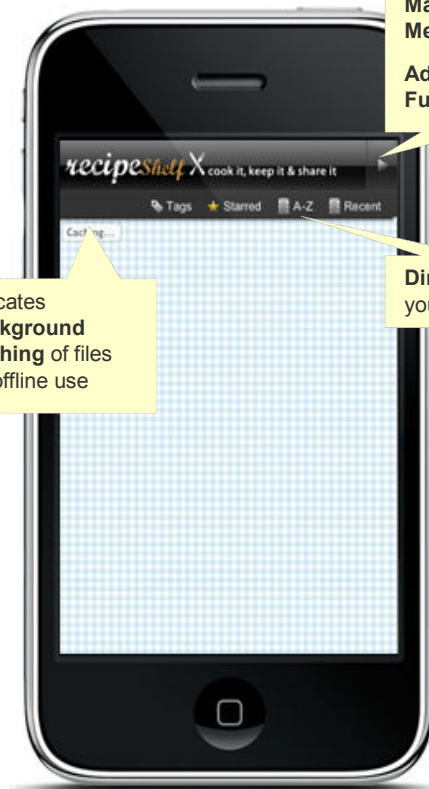

## iPhone Screenshots : Application Features

Email recipe to a friend

This recipeShelf feature or section may **only be of relevance** to you, in the event you **intend to make your recipe information publicly available** and have them found by Google Recipe Search. Either through your own blog, website or other online publications.

Simply copy & paste the code into your blog and voila, Google will be able to find it.

This button will add a tiny bit of extra code that attempts to hide the entire code block once you copied it to your blog by simply moving it outside the viewport. Google however will still be able to see it just fine.

**Click “Select All”, then copy and paste into your blog or website.**

**IMPORTANT:**

**When pasting** it into your blog, make sure to use your blog’s **HTML editor** feature, otherwise you end up with this code block **as-is** on your site.

## Application Security

With **version 1.3** I've made every attempt to enhance security across the board, primarily addressing XSS hack/spam attempts as well as SQL injection.

If you do see odd, unexpected behaviour please let us know.
